1. Building the Table:

2. Static vs. Dynamic Dispatch:

```
Animal a = new Puppy();
a.speak();
```

Static dispatch would return Animal::speak() while dynamic dispatch would return Dog::speak(). This is because static dispatch does not look into the actual subclass like dynamic dispatch at runtime.

3. Polymorphism Trace

Animal()->Animal::name()
Dog()->Animal::name()
Puppy()->Puppy::name()

Dog::name() is never defined so it never overrides Animal::name().
